

Git Cheat Sheet

Git Configuration

<i>command</i>	<i>description</i>
<code>git config --global user.name "Katia Oleinik"</code>	
<code>git config --global user.email "koleinik@bu.edu"</code>	
<code>git config --global core.editor "nano"</code>	
<code>git config --list [--global / --local]</code>	list current settings
<code>git config --list --show-origin</code>	display path to config files

Getting help

<i>command</i>	<i>description</i>
<code>git help verb</code>	full manpage for <i>verb</i>
<code>man git-verb</code>	full manpage for <i>verb</i>
<code>git verb -h</code>	concise help for <i>verb</i>

Creating Local Repository

<i>command</i>	<i>description</i>
<code>git init dirname</code>	create a new empty repository
<code>git init</code>	a new git repo in an existing folder
<code>git clone /project/scv/dirname</code>	clone local repository
<code>git clone https://github.com/bu-racs/newpkg.git</code>	clone remote repository

Exploring git repository

<i>command</i>	<i>description</i>
<code>tree .git</code>	list content of <i>.git</i> directory
<code>git ls-tree master .</code>	list content of a git tree object
<code>git status</code>	check status of your repository
<code>git status -sb</code>	show status concisely
<code>git log</code>	show commit log
<code>git log --3</code>	show last 3 commits
<code>git log --graph</code>	draw branch graph on the left
<code>git log --oneline</code>	compact log
<code>git log -- file1</code>	list commits with specific file modified
<code>git log --author="Katia Oleinik"</code>	filter by author
<code>git log --after="2019-1-30"</code>	filter by date
<code>git log --grep="fix"</code>	search commit messages
<code>git config --global alias.lg "log --oneline"</code>	create an alias
<code>git show ae12375</code>	show info about specific commit

Git Commit Workflow

<i>command</i>	<i>description</i>
<code>git add file1 file2</code>	add files to staging area
<code>git add .</code>	add all changes in directory (no deleted files)
<code>git add -A</code>	add all new, modified and delete files to staging area
<code>git commit -m "Initial commit"</code>	create commit with short message
<code>git commit</code>	create a commit (editor will open)
<code>git tag -a v2.15 ae12375</code>	Add a tag to a specific commit

View file source in a commit

<i>command</i>	<i>description</i>
<code>git show HEAD:filename</code>	view source of the file in the last commit
<code>git show 0721696:filename</code>	view source in a specific commit
<code>git annotate filename</code>	show who made changes to the file

Travelling in time

<i>command</i>	<i>description</i>
<code>git checkout 0721696</code>	change state to a specific commit
<code>git checkout master</code>	go back to the present time

Remote repository workflow

<i>command</i>	<i>description</i>
<code>git remote add origin url</code>	connect local and remote repositories
<code>git push origin master</code>	push changes to remote repository
<code>git pull origin master</code>	pull changes to remote repository

Resolving conflicts

1. Make commit
2. `git push origin master` (results in error)
3. `git pull origin master`
4. If editor is opened edit merge commit message. Otherwise edit a file, add and commit it
5. `git push origin master`

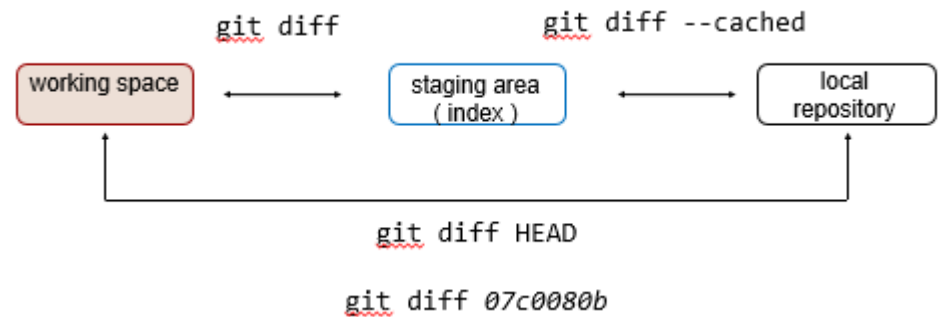

Branches

<i>command</i>	<i>description</i>
<code>git branch</code>	list all existing branches
<code>git branch --list</code>	list all branch names
<code>git branch -a</code>	list remote and local branches
<code>git branch -v</code>	verbose output
<code>git branch <i>branchName</i></code>	create a new branch
<code>git branch -d <i>branchName</i></code>	delete branch (only if it's merged)
<code>git branch -D <i>branchName</i></code>	delete branch (even if not merged)
<code>git checkout <i>branchName</i></code>	create a new branch
<code>git checkout -b <i>branchName</i></code>	create and checkout a new branch
<code>git merge <i>branchName</i></code>	merge <i>branchName</i> into current branch

Stash

<i>command</i>	<i>description</i>
<code>git stash</code>	Temporary store modified tracked files
<code>git stash pop</code>	restores stashed files
<code>git stash list</code>	list all stashed changes
<code>git stash drop</code>	discard most recent shash changes

Exploring differences/changes

Discard changes

remove file from staging area
`git reset HEAD -- /path/to/file`

unstage all files
`git reset`
